**Title:** Large time behaviour of symmetric random walk in high-contrast periodic environment.

**Abstract:** Asymptotic properties of a symmetric random walk in a high contrast periodic medium on the lattice are considered. We show that under proper diffusive scaling the random walk exhibits a non-standard limit behaviour. In addition to the coordinate of the random walk in \( \mathbb{Z}^d \) we introduce an extra variable that characterizes the position of the random walk in the period and show that this two-component process converges in law to a limit Markov process. The components of the limit process are mutually coupled, thus we cannot expect that the limit behaviour of the coordinate process is Markov.
